

Object Interaction 1

Creating cooperating objects

This week:
Assignment 1 starts

A digital clock

11:03

Abstraction and modularisation

- **Abstraction** is the ability to ignore details of parts to focus attention on a higher level of a problem.
- **Modularisation** is the process of dividing a whole into well-defined parts, which can be built and examined separately, and which interact in well-defined ways.

Modularising the clock display

11:03

One four-digit display?

Or two two-digit displays?

11

03

And a bit of glue ...

:

Objects First with Java - A Practical Introduction using BlueJ, © David J. Barnes, Michael Kölling

Implementation - NumberDisplay

```
public class NumberDisplay
{
    private int limit;
    private int value;

    ... constructor omitted
    ... methods omitted
}
```

Implementation - ClockDisplay

```
public class ClockDisplay
{
    private NumberDisplay hours;
    private NumberDisplay minutes;

    ... constructor omitted
    ... methods omitted
}
```

Primitive types vs. Object types

`int i;`

42

primitive type

`SomeObject obj;`

object type

Objects First with Java - A Practical Introduction using BlueJ, © David J. Barnes, Michael Kölling

Quiz: What is the output?

```
int a;
int b;
a = 42;
b = a;
a = a + 1;           // has b changed?
System.out.println(b);
```

```
Person a;
Person b;
a = new Person("Everett");
b = a;
a.changeName("Delmar"); // has b changed?
System.out.println(b.getName());
```

Quiz: What is the output?

- ```
int a;
int b;
a = 42;
b = a;
a = a + 1;
System.out.println(b);
```

 // has b changed?  
 no
- ```
Person a;
Person b;
a = new Person("Everett");
b = a;
a.changeName("Delmar");
System.out.println(b.getName());
```

 // has b changed?
 yes

Source code: NumberDisplay

```
public NumberDisplay(int rollOverLimit)
{
    limit = rollOverLimit;
    value = 0;
}

public void increment()
{
    value = (value + 1) % limit;
}
```

The modulo operator

- The *'division'* operator (*/*), when applied to int operands, returns the *integer result* of an *integer division*.
- The *'modulo'* operator (*%*) returns the *integer remainder* of an *integer division*.
- Example:
 $17 / 5 = \text{result } 3, \text{ remainder } 2$
- In Java:
 $17 / 5 = 3$
 $17 \% 5 = 2$

Objects First with Java - A Practical Introduction using BlueJ, © David J. Barnes, Michael Kölling

Quiz

- What is the result of the expression $(8 \% 3)$
- What are all possible results of the expression $(n \% 5)$?

Objects First with Java - A Practical Introduction using BlueJ, © David J. Barnes, Michael Kölling

Source code: NumberDisplay

```
public String getDisplayValue()  
{  
    if (value < 10) {  
        return "0" + value;  
    }  
    else {  
        return "" + value;  
    }  
}
```
