# Experimenting with Architecture Evaluation to Improve Software Dependability

Sima Asgari, Victor Basili, Patricia Costa, Paolo Donzelli, Lorin Hochstein,  
Mikael Lindvall, Ioana Rus, Forrest Shull, Roseanne Tvedt, Marvin Zelkowitz

**Fraunhofer USA**

Center for  
Experimental Software Engineering  
Maryland

# High Dependability Computing Project

## Contents

- ▶ 1 Overview
- 2 UMD Model
- 3 Fault seeding
- 4 Arch evaluation
- 5 Testbed
- 6 Status

- Improve NASA's ability to build dependable software
- Investigate, foster, and transfer to practice new technologies developed by researchers at multiple universities
- Use testbeds for technology assessment: scaled-down versions of systems in domains which require high dependability
  - Autonomous rovers
  - Air traffic control systems

Rocky 7 rover

- Work in progress

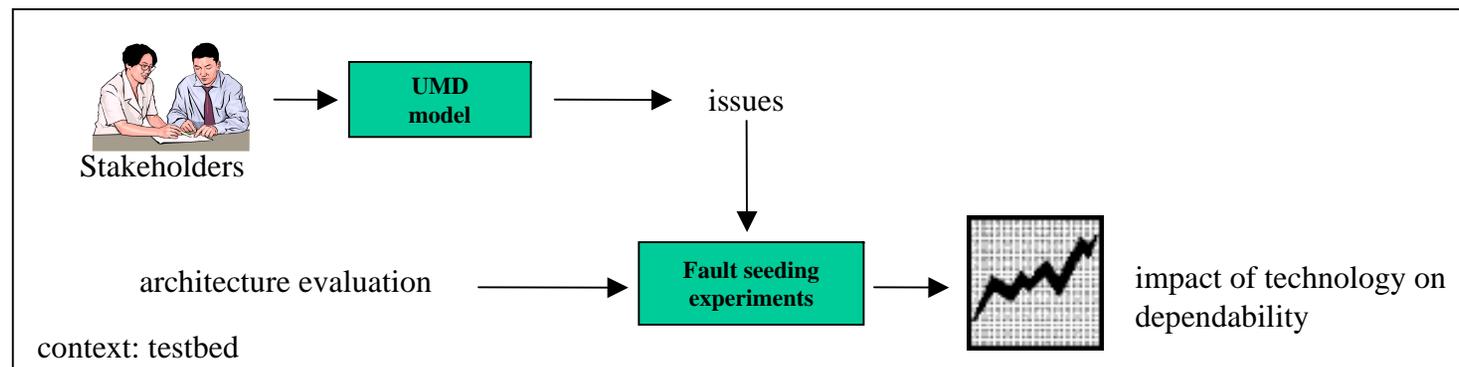

# Fraunhofer & UMD's Role in HDCP

## Contents

- ▶ 1 Overview
- 2 UMD Model
- 3 Fault seeding
- 4 Arch evaluation
- 5 Testbed
- 6 Status

- Goal: Evaluate value of technology from stakeholder's perspective (e.g. system users, system developers)
- Empirical approach
  - Use experiments to understand & improve technologies
- Current work
  - Unified Model of Dependability (UMD)
  - Dependability-driven fault seeding
  - Architecture evaluation technique

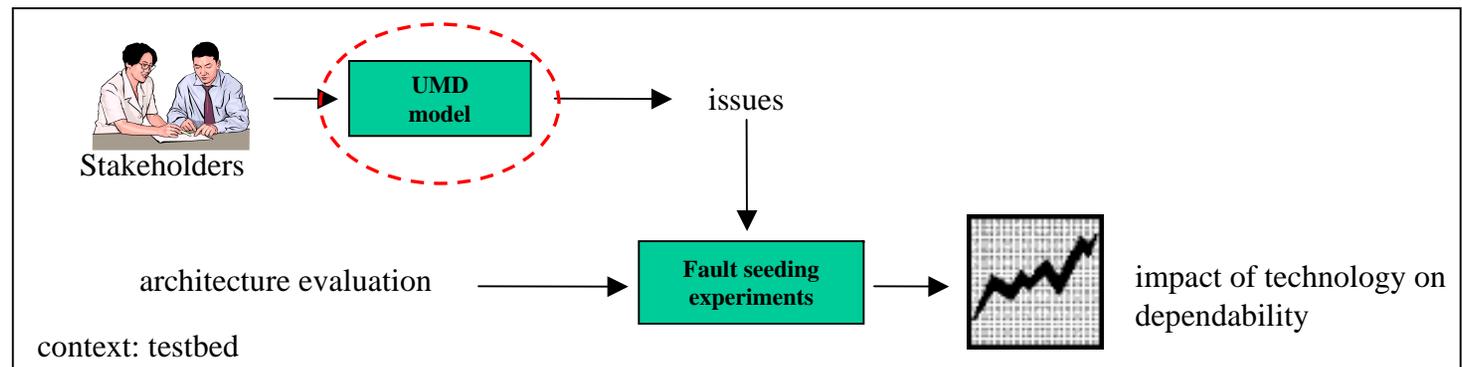

# Unified Model of Dependability (UMD)

## Contents

- 1 Overview
- ▶ 2 UMD Model
- 3 Fault seeding
- 4 Arch evaluation
- 5 Testbed
- 6 Status

- Goal of UMD
  - Provide common language for discussing dependability
  - Help stakeholders define dependability needs as measurable system properties
- Stakeholders define undesirable **issues** that may affect the system, together with possible triggering external **events**
- Examples of issues: failures, hazards

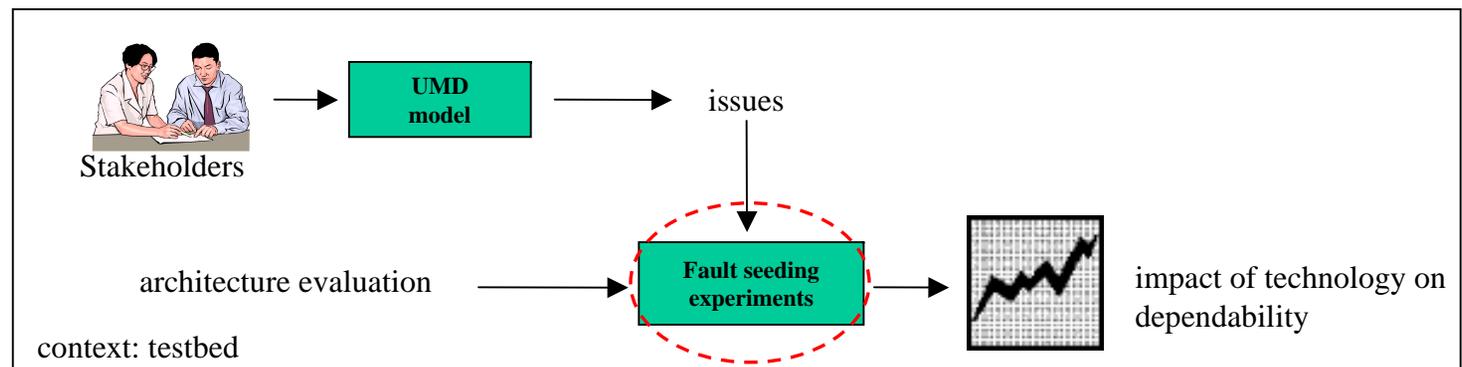

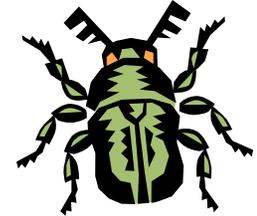

# Dependability-driven Fault Seeding

## Contents

- 1 Overview
- 2 UMD Model
- 3 Fault seeding
- 4 Arch evaluation
- 5 Testbed
- 6 Status

- Overview
  - Seed faults in testbed artifacts
  - Apply technology to artifact
  - Identify impact of technology on faults, failures
- Evaluate claims of researcher
  - Technology-specific faults
    - Based on technology claims, seed types of faults that technology should be able to detect
- Evaluate impact of technology on **dependability** of testbed
  - Failure-related faults
    - Identify failures of interest (output of UMD model)
    - Hazard analysis to identify faults that could lead to those failures

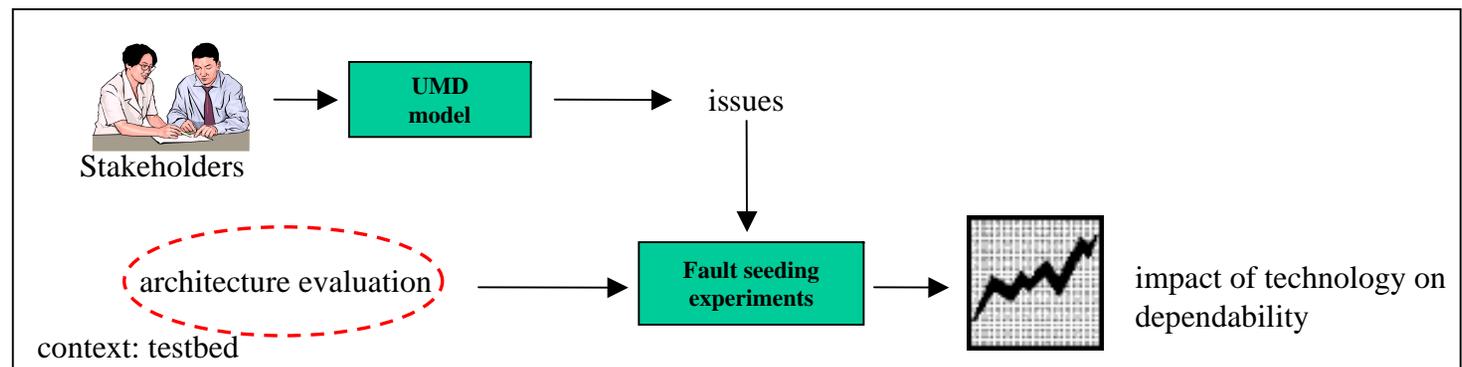

# Sample Technology: Architectural Evaluation

## Contents

- 1 Overview
- 2 UMD Model
- 3 Fault seeding
- ▶ 4 Arch evaluation
- 5 Testbed
- 6 Status

- Architectural evaluation
  - Detect architectural violations and non-conformances between planned and actual architecture
- Has been used on several systems with encouraging results.
  - Architectural violations are common
  - Cause software to decay, hard to maintain
  - AE can quickly detect violations (keep architecture on track)

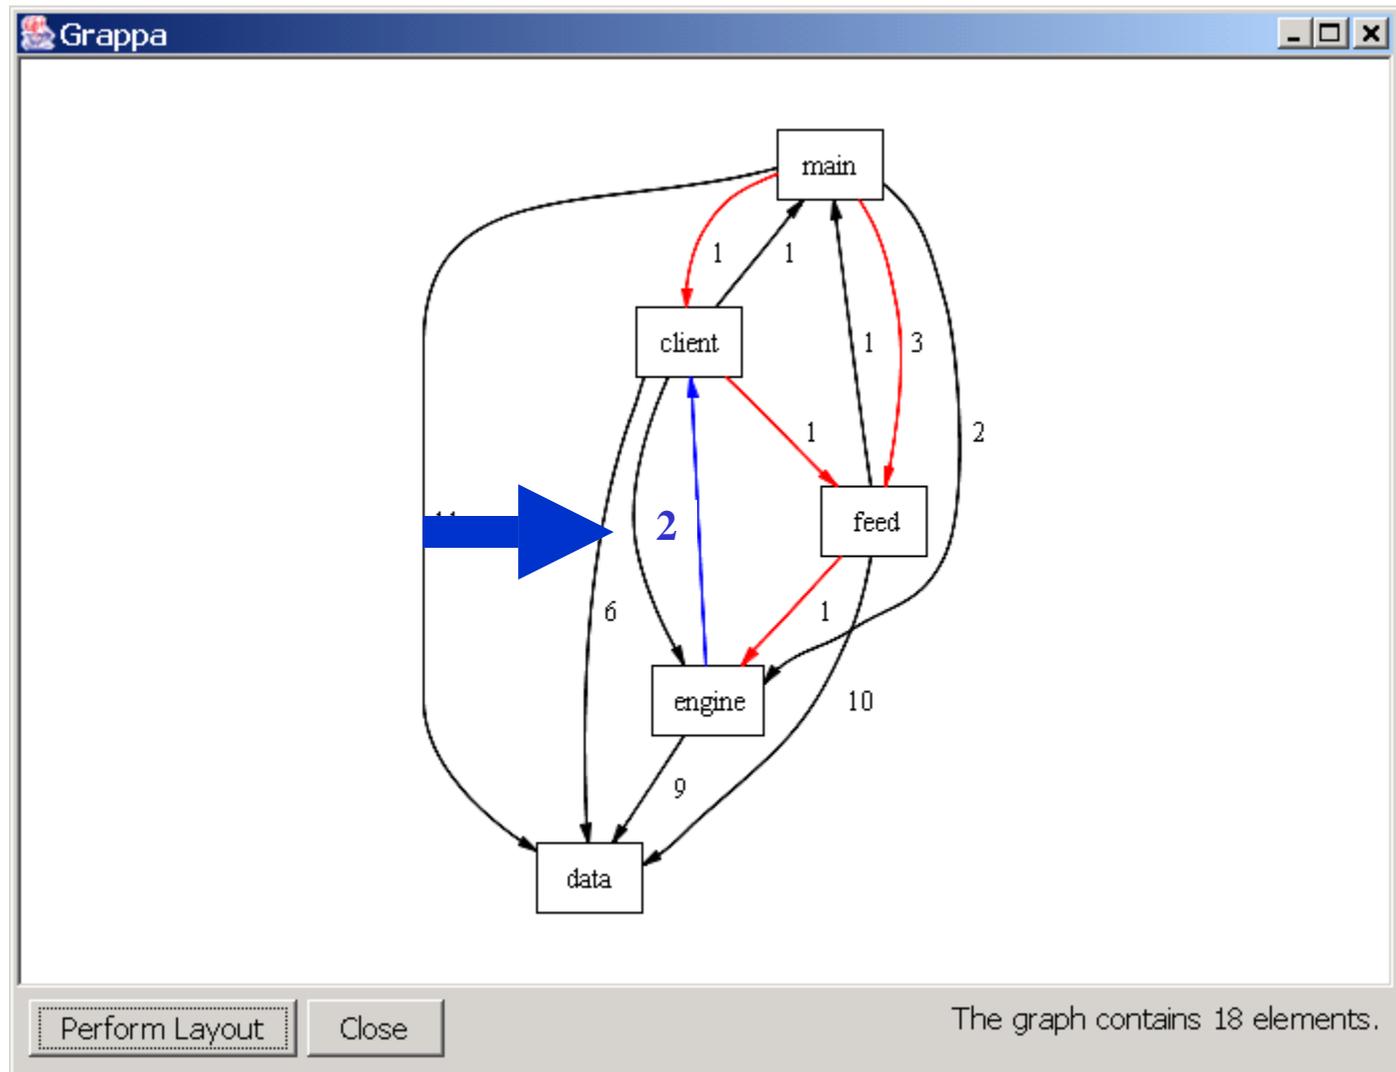

# Example – Planned/Actual Comparison

## Contents

- 1 Overview
- 2 UMD Model
- 3 Fault seeding
- 4 Arch evaluation
- 5 Testbed
- 6 Status

A link between client and engine is missing.

## Testbed: TSAFE

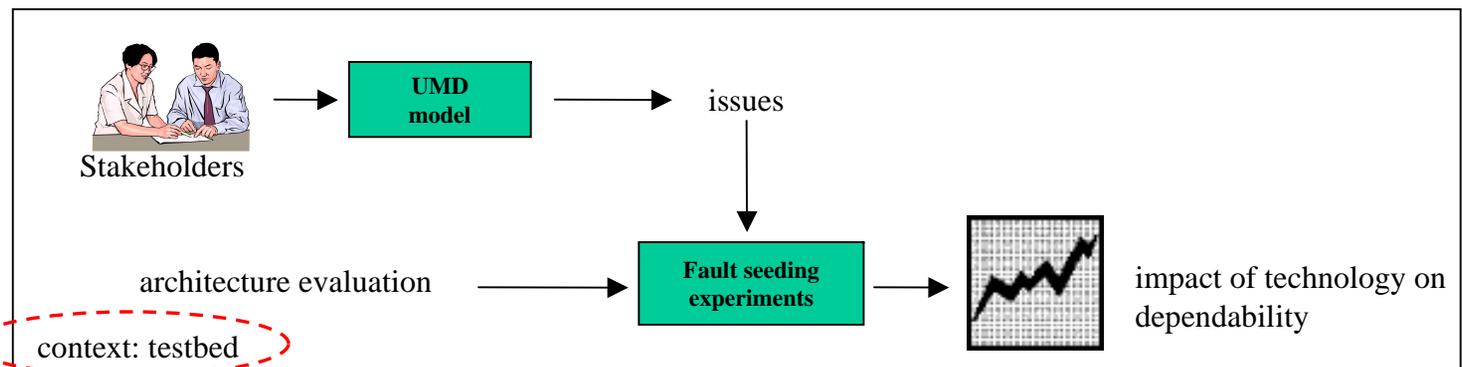

# Tactical Separation Assisted Flight Environment

### Contents

- 1 Overview
- 2 UMD Model
- 3 Fault seeding
- 4 Arch evaluation
- ▶ 5 Testbed
- 6 Status

- Aids air-traffic controllers in detecting short-term aircraft conflicts
- Proposed as principle component of larger Automated Airspace Computing System
- MIT TSAFE testbed; a partial implementation
  - Determines if plane is conforming to flight plan
  - ~ 20 KLOC of Java

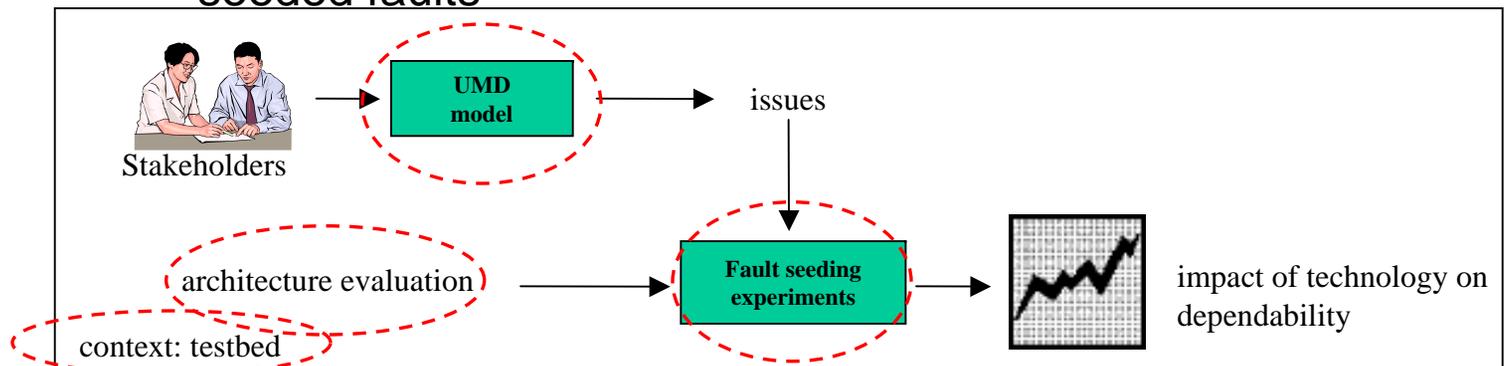

## Using TSAFE as a Testbed

### Contents

- 1 Overview
- 2 UMD Model
- 3 Fault seeding
- 4 Arch evaluation
- ▶ 5 Testbed
- 6 Status

- Applying UMD model to TSAFE
  - Determine feasibility of approach
  - Evaluate usefulness of web-based support tool
  - Identify failures of interest
- Applying fault seeding to TSAFE
  - Using failures from UMD model, identify possible source code faults which would cause those failures
  - Identify possible architecture-related faults that architecture evaluation method should catch
- Applying architectural evaluation to TSAFE
  - Use independent expert to apply technique on TSAFE with seeded faults

## Current Status

### Contents

- 1 Overview
- 2 UMD Model
- 3 Fault seeding
- 4 Arch evaluation
- 5 Testbed
- ▶ 6 Status

- Current status
  - Expert is applying architecture evaluation to fault-seeded version of TSAFE
  - Building a database of potential TSAFE faults for use in future experiments
  - Evolving UMD model
- Future work
  - Analyze results of architecture evaluation experiment
  - Evaluate other technologies using TSAFE (e.g. code inspections)
  - Perform experiment using other HDCP testbeds (e.g. USC Full-Service Robot)

## reaction

- characterization:*
- **Impact mitigation**
    - warnings
    - alternative services
    - mitigation services
  - **Recovery**
    - recovery time
    - recovery actions
  - **Occurrence reduction**
    - guard services

## measure

- characterization:*
- **Time-based**
    - MTTF
    - Probability of occurrence
    - .....
  - **Absolute**
    - number of occurrences
    - .....
  - **Ordinal**
    - very rarely/rarely/some-times

## event

- characterization:*
- **Type**
    - Adverse Condition
    - Attack
    - Upgrades

## FAILURE

- characterization:*
- **Type**
    - Accuracy failure
    - Performance failure
    - Other failure
  - **Availability impact**
    - Stopping
    - Non-Stopping

## HAZARD

- characterization:*
- **Type**
    - User(s) hazard
    - Environment hazard

## scope

- characterization:*
- **Type**
    - Whole System
    - Service
  - **Operational Profile Description**
    - Distribution of transaction
    - Workload volumes
    - etc.

# What Is Dependability and How Is It Defined?

## Contents

- 1 Overview
- 2 UMD Model
- 3 Fault seeding
- 4 Arch evaluation
- 5 Testbed
- 6 Status

University of Maryland Dependability Framework (UMD framework) defines system dependability based on **Issues**, e.g. assume **Issues = Failures** then

**Less Failures  $\Leftarrow$  More Dependable**
