February 17, 2010

$$C \Rightarrow \tau$$

Type classes

Data types

Type synonyms

Type synonym families

## Reminder: Type families

```
type family Collection e
type instance Collection Int = [Int]
type instance Collection Bool = Int
```

e.g. `Collection Int → [Int]`

$$C \Rightarrow \tau$$

Type classes  
(Equality constraints)

Data types (GADTs)  
Type synonyms  
Type synonym families  
Data type families

# Haskell Type Constraints ~~Unleashed~~ Beefed-Up!

Dominic Orchard

February 17, 2010

## Example 1: Set functor

```
class Functor f where
```

```
  fmap :: (a -> b) -> f a -> f b
```

```
instance Functor [] where
```

```
  fmap = map
```

```
instance Functor Set where
```

```
  fmap = Set.map
```

$Set.map :: (Ord\ a, Ord\ b) \Rightarrow (a \rightarrow b) \rightarrow Set\ a \rightarrow Set\ b$

## Example 2: Polymorphic EDSL

```
class Expr sem where
  constant :: a -> sem a
  add      :: sem a -> sem a -> sem a
```

e.g. `(constant 1) 'add' (constant 2)` could denote  $1 + 2$ .

```
data E a = MkE {eval :: a}
```

```
instance Expr E where
  constant c = MkE c
  add e1 e2 = MkE $ eval e1 + eval e2
```

$(+)$  :: **Num**  $a \Rightarrow a \rightarrow a \rightarrow a$

## Example 2: Polymorphic EDSL

```
class Expr sem where
  constant :: a -> sem a
  add      :: Num a => sem a -> sem a -> sem a
```

e.g. `(constant 1) 'add' (constant 2)` could denote  $1 + 2$ .

```
data E a = MkE {eval :: a}
```

```
instance Expr E where
  constant c = MkE c
  add e1 e2  = MkE $ eval e1 + eval e2
```

$(+) :: \text{Num } a \Rightarrow a \rightarrow a \rightarrow a$

## Axis: Families

|                  |                   | <i>types</i>  | <i>constraints</i>                            |
|------------------|-------------------|---|---|
| <i>constants</i> | <i>generative</i> | Data types<br><b>data</b> $T \bar{a}$ where ...   | Classes<br><b>class</b> $K \bar{a}$ where ... |
|                  | <i>synonym</i>    | Type synonyms<br><b>type</b> $T \bar{a} = \tau$   |   |

| <i>families</i>  | <i>generative</i> | Data type families<br><b>data family</b> $T \bar{a}$<br><b>data instance</b> $T \bar{\tau} = \dots$   |   |
|                  | <i>synonym</i>    | Type synonym families<br><b>type family</b> $T \bar{a}$<br><b>type instance</b> $T \bar{\tau} = \tau$ |   |

# Constraint Synonyms

|                  |                   | <i>types</i>  | <i>constraints</i>                                       |
|------------------|-------------------|---|--|
| <i>constants</i> | <i>generative</i> | Data types<br><b>data</b> $T \bar{a}$ where ...   | Classes<br><b>class</b> $K \bar{a}$ where ...            |
|                  | <i>synonym</i>    | Type synonyms<br><b>type</b> $T \bar{a} = \tau$   | Constraint synonyms<br><b>constraint</b> $K \bar{a} = C$ |
| <i>families</i>  | <i>generative</i> | Data type families<br><b>data family</b> $T \bar{a}$<br><b>data instance</b> $T \bar{\tau} = \dots$   |  |
|                  | <i>synonym</i>    | Type synonym families<br><b>type family</b> $T \bar{a}$<br><b>type instance</b> $T \bar{\tau} = \tau$ |  |

## Example (without constraint synonyms)

```
eval :: (Solver s, Queue q, Transformer t,  
        Elem q ~ (Label s, Tree s a, TreeState t),  
        ForSolver t ~ s)  
=> ...
```

```
eval' :: (Solver s, Queue q, Transformer t,  
         Elem q ~ (Label s, Tree s a, TreeState t),  
         ForSolver t ~ s)  
=> ...
```

## Example (with constraint synonyms)

```
constraint Eval s q t a =  
  (Solver s, Queue q, Transformer t,  
   Elem q ~ (Label s, Tree s a, TreeState t),  
   ForSolver t ~ s)
```

```
eval :: Eval s q t a => ...
```

```
eval' :: Eval s q t a => ...
```

# Constraint Synonym Families

# Constraint Synonym Families

constraint family  $K \bar{a}$

constraint instance  $K \bar{\tau} = C$

## Example 1: Set functor

```
class Functor f where
```

```
  fmap :: (a -> b) -> f a -> f b
```

```
instance Functor [] where
```

```
  fmap = map
```

```
instance Functor Set where
```

```
  fmap = Set.map
```

$Set.map :: (Ord\ a, Ord\ b) \Rightarrow (a \rightarrow b) \rightarrow Set\ a \rightarrow Set\ b$

## Example 1: Set functor - Solution 1

```
constraint family Inv f e
constraint instance Inv [] e = ()
constraint instance Inv Set e = Ord e
```

```
class Functor f where
    fmap :: (Inv f a, Inv f b) => (a -> b) -> f a -> f b
```

```
instance Functor [] where
    fmap = map
```

```
instance Functor Set where
    fmap = Set.map
```

## Example 1: Set functor - Solution 2 (Associated)

class Functor f where

`constraint Inv f e`

`fmap :: (Inv f a, Inv f b) => (a -> b) -> f a -> f b`

instance Functor [] where

`constraint Inv [] e = ()`

`fmap = map`

instance Functor Set where

`constraint Inv Set e = Ord e`

`fmap = Set.map`

## Example 1: Set functor - Solution 3 (+ default)

class Functor f where

```
constraint Inv f e = ()
```

```
fmap :: (Inv f a, Inv f b) => (a -> b) -> f a -> f b
```

instance Functor [] where

```
fmap = map
```

<- note: unchanged!

instance Functor Set where

```
constraint Inv Set e = Ord e
```

```
fmap = Set.map
```

## Example 2: Polymorphic EDSL

```
class Expr sem where
  constant :: a -> sem a
  add      :: sem a -> sem a -> sem a
```

```
data E a = MkE {eval :: a}
```

```
instance Expr E where
  constant c = MkE c
  add e1 e2 = MkE $ eval e1 + eval e2
```

$(+)$  :: **Num**  $a \Rightarrow a \rightarrow a \rightarrow a$

## Example 2: Polymorphic EDSL

```
class Expr sem where
  constraint Pre sem a = ()
  constant :: Pre sem a => a -> sem a
  add      :: Pre sem a => sem a -> sem a -> sem a
```

```
data E a = MkE eval :: a
```

```
instance Expr E where
  constraint Pre E a = Num a
  constant c = MkE c
  add e1 e2 = MkE $ eval e1 + eval e2
```

# Well-defined Families

- Confluence
  - No overlapping instances
  - No type-families application in instance heads

```
constraint family K f a
```

① `constraint instance K [] a = ()`

② `constraint instance K (T a) a = Ord a`

```
type instance T Char = BitSet
```

```
type instance T Int = []
```

Given constraint  $K [] \text{Int}$ :

①  $K [] \text{Int} = ()$

②  $K (T \text{Int}) \text{Int} \rightarrow K [] \text{Int}$

$= \text{Ord Int}$

$\neq ()$

# Well-defined Families

- Confluence
  - No overlapping instances
  - No type-families application in instance heads
- Termination

# Termination

(Based on type family termination <sup>1</sup>)

constraint instance  $K \bar{\tau} = C$

$\forall$  constraint family applications  $K' \bar{\tau}' \in C$ :

- 1  $|\bar{\tau}| > |\bar{\tau}'|$  (strictly decreasing)
- 2  $\bar{\tau}'$  has no more occurrences of any type variable than LHS

---

<sup>1</sup>Schrijvers, T., Jones, S.P., Chakravarty, M., Sulzmann, M.: Type checking with open type functions. SIGPLAN Not. 43(9) (2008) 5162

## Termination (condition 2)

- ②  $\bar{\tau}'$  has no more occurrences of any type variable than LHS

e.g.

constraint family  $K \ m \ a$

constraint instance  $K \ [a] \ b = K \ b \ b$

if  $b = [a]$

$K \ [a] \ b \rightarrow K \ [a] \ [a] \rightarrow K \ [a] \ [a] \rightarrow \dots$

## Termination

constraint instance  $K \bar{\tau} = C$

$\forall$  constraint family applications  $K' \bar{\tau}' \in C$ :

- 1  $|\bar{\tau}| > |\bar{\tau}'|$  (strictly decreasing)
- 2  $\bar{\tau}'$  has no more occurrences of any type variable than LHS
- 3  $\bar{\tau}'$  does not contain any type family applications

## Termination (condition 3)

- ③  $\bar{\tau}'$  does not contain any type family applications

constraint family  $K\ m\ a$

- ① constraint instance  $K\ (T\ (T\ m))\ a = K\ (F\ m)\ a$

$$|(T\ (T\ m))\ a| = 4 \quad |(F\ m)\ a| = 3$$

type family  $F\ m$

- ② type instance  $F\ Int = T\ (T\ Int)$

$$K\ (T\ (T\ Int))\ a \xrightarrow{\textcircled{1}} K\ (F\ Int)\ a \xrightarrow{\textcircled{2}} K\ (T\ (T\ Int))\ a \xrightarrow{\textcircled{1}} \dots$$

## Termination

constraint instance  $K \bar{\tau} = C$

$\forall$  constraint family applications  $K' \bar{\tau}' \in C$ :

- 1  $|\bar{\tau}| > |\bar{\tau}'|$  (strictly decreasing)
- 2  $\bar{\tau}'$  has no more occurrences of any type variable than LHS
- 3  $\bar{\tau}'$  does not contain any type family applications

# State of play

|                  |                   | <i>types</i>  | <i>constraints</i>   |
|------------------|-------------------|---|--|
| <i>constants</i> | <i>generative</i> | Data types<br><b>data</b> $T \bar{a}$ where ...   | Classes<br><b>class</b> $K \bar{a}$ where ...  |
|                  | <i>synonym</i>    | Type synonyms<br><b>type</b> $T \bar{a} = \tau$   | Constraint synonyms<br><b>constraint</b> $K \bar{a} = C$   |
| <i>families</i>  | <i>generative</i> | Data type families<br><b>data family</b> $T \bar{a}$<br><b>data instance</b> $T \bar{\tau} = \dots$   | Class families?  |
|                  | <i>synonym</i>    | Type synonym families<br><b>type family</b> $T \bar{a}$<br><b>type instance</b> $T \bar{\tau} = \tau$ | Constraint synonym families<br><b>constraint family</b> $K \bar{a}$<br><b>constraint instance</b> $K \bar{\tau} = C$ |

## Paper contributions

- Constraint synonyms and constraint synonym families
- Static semantics rules
- Termination conditions for constraint families (and interaction with classes)
- Provide encodings into GHC/Haskell and System  $F_C$

## Further work

- Implement in GHC
- Improving refactoring with class synonym instances
- Open vs. closed as an axis

## Improving refactoring with class synonym instances

```
constraint Num a
  = (Additive a, Multiplicative a, FromInteger a)
```

```
instance Num Int where ...
```

but

```
constraint Eq' a b = (Eq a, Eq b)
instance Eq' [Int] [Char] where
  x (==) y = ...
  x (==) y = ...
```

which (==) implementation is which?

## Conclusions

- Symmetrised the type system along the constraint-type divide
- Constraint synonyms: Easier to read/write code
- Constraint synonym families: Index constraints based on types
- Fixes many problems (functor problem)
- Polymorphic EDSLs can be polymorphic again, even with constraints!

**Haskell Type Constraints Beefed-Up!**
