 Burt Arief Senior Lecturer, Centre Director of External Liaison School of Computing	Cyber crime, human factors in security, internet of things security and privacy.	B.Arief@kent.ac.uk
 Ozgur Kafali Lecturer in Cyber Security School of Computing	Socio-technical and human factors in cybersecurity, security requirements engineering, formal breach analysis, digital forensics.	R.O.Kafali@kent.ac.uk
 Andy King Professor in Program Analysis, Centre Director of Research School of Computing	Vulnerability discovery using program analysis techniques, reverse engineering tools for white-hat hackers.	A.M.King@kent.ac.uk

# Research Background

## Science of Security Lablet

North Carolina State University's (NCSU) Science of Security Lablet (SoSL) has embraced and helped build a foundation for NSA's vision of the Science of Security (SoS) and of a SoS community. We have emphasized data-driven discovery and analytics to formulate, validate, evolve, and solidify the theory and practice of security. Efforts in our current lablet have yielded significant findings, providing a deeper understanding of users' susceptibility to deception, developers' adoption of security tools, how trust between people relates to their commitments. These efforts have led to over 50 peer-reviewed publications with more on the way. The lablet has supported 32 faculty and students and engaged more than 30 colleagues from industry.

Motivated by NSA's overarching vision for SoS and building on our experience and accomplishments, we will continue (1) developing a science-based foundation for the five hard problems that we previously helped

# Common Factor in Breaches

- Mostly humans

## Common Factor in Breaches

- Mostly humans
- More broadly: Sociotechnical and human factors

## Common Factor in Breaches

- Mostly humans
- More broadly: Sociotechnical and human factors
- Corroborated by reports from
  - Governments
  - Organisations
  - Academic studies

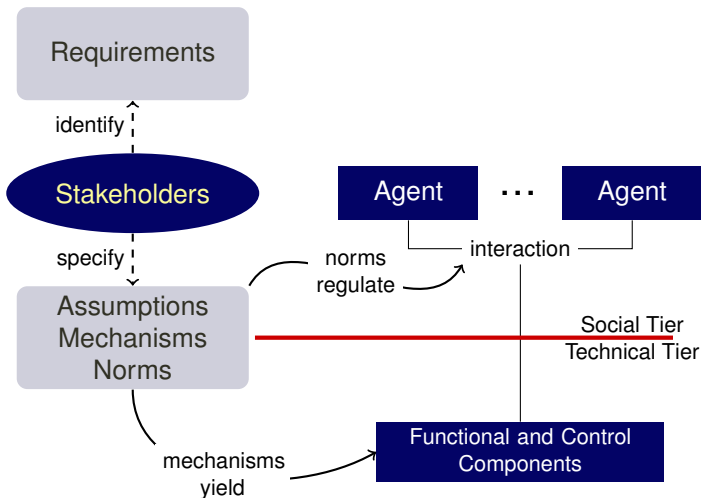

# Sociotechnical Systems (STS)

- STS: Any modern ICT system
  - Technical: Computers and software components
  - Social: People and interactions

# Sociotechnical Systems (STS)

- STS: Any modern ICT system
  - Technical: Computers and software components
  - Social: People and interactions
- Consider a hospital environment
  - Technical: Electronic health records (EHR) software
  - People: Doctors, nurses, patients
  - Interactions: Doctor consulting a colleague

# STS Conception

## Regulatory Norms

---

Credit to my colleague Munindar Singh

# Security Requirements and Regulations

- Correspond to “authorizations”, “commitments”, and “prohibitions”
- Authorization: A doctor is authorized to access a patient’s EHR if the patient gives consent
- Commitment: The hospital is committed to keeping patients’ EHR secure
- Prohibition: A doctor is prohibited from disclosing a patient’s protected health information (PHI) to outsiders

## Challenges

- Elicitation: Extracting functional requirements is hard, extracting security and privacy requirements is (almost) impossible
- Hybrid approaches for extraction of requirements from regulations and breaches
  - Human intelligence: Crowdsourcing
  - Machine intelligence: Natural language processing (NLP)

## Challenges

- Elicitation: Extracting functional requirements is hard, extracting security and privacy requirements is (almost) impossible
- Hybrid approaches for extraction of requirements from regulations and breaches
  - Human intelligence: Crowdsourcing
  - Machine intelligence: Natural language processing (NLP)
- Ambiguity

## Need for Intelligence: Breaches vs Bridges

## Core Research Questions

- RQ<sub>1</sub> – Verification: How can we verify an STS specification against the requirements of its stakeholders?
- RQ<sub>2</sub> – Design: How can we design a secure and privacy-aware STS with respect to tradeoffs and conflicts among its requirements?
- RQ<sub>3</sub> – Extraction: How can we identify potential malicious and accidental misuses, and associated requirements of an STS?

## RQ<sub>1</sub>: Requirements Verification

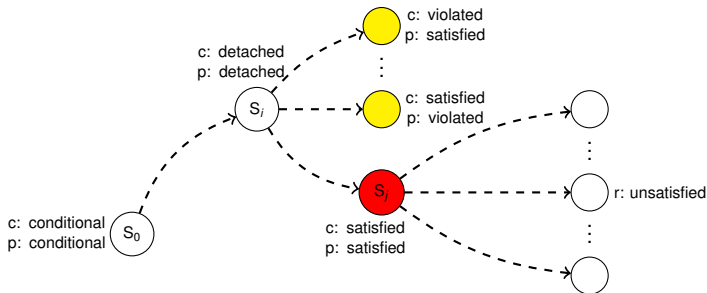

c: conditional  
p: conditional

## RQ<sub>1</sub>: Requirements Verification

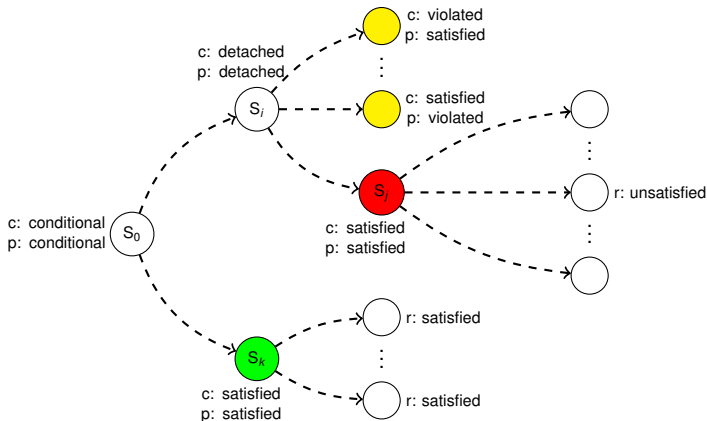

## RQ<sub>1</sub>: Requirements Verification

## RQ<sub>1</sub>: Requirements Verification

## RQ<sub>2</sub>: STS Design with Tradeoffs

- Regime (technical) or regulate (social)?
- Functionality or security?
- Comply with multiple regulations
  
- Design patterns
- Refinement based on changing requirements

## RQ<sub>3</sub>: Requirements Extraction

- Normative formalization to connect regulations and breaches
- Ontology of breach concepts
- Semantic similarity metric to identify gaps or holes

Kafalı et al. How Good is a Security Policy against Real Breaches? A HIPAA Case Study. Proceedings of the 39th International Conference on Software Engineering (ICSE), pages 530-540, 2017

## Breach Analysis

- HHS breach incident: In 2010, an employee in a covered entity forgot to erase data contained on disposed photocopiers' hard drives, which led to disclosure of patient records.
- HIPAA clause 45 CFR 164.310–(d)(2)(i): “A covered entity or business associate must implement policies and procedures to address the final disposition of electronic protected health information, and the hardware or electronic media on which it is stored.”

---

HHS: US Department of Health and Human Services

HIPAA: US Health Insurance Portability and Accountability Act

## Breach Analysis

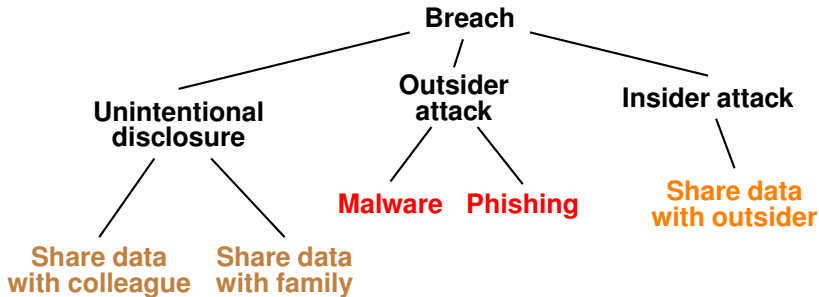

- HHS breach incident: In 2010, an **employee** in a **covered entity** forgot to **erase** data contained on **disposed photocopiers' hard drives**, which led to disclosure of patient records.
- HIPAA clause 45 CFR 164.310–(d)(2)(i): “A **covered entity** or business associate must implement policies and procedures to address the final **disposition** of electronic protected health information, and the **hardware or electronic media** on which it is stored.”

Breach Portal: Notice to the Secretary of HHS Breach of Unsecured Protected Health Information

## Breaches Affecting 500 or More Individuals

As required by section 13402(e)(4) of the HITECH Act, the Secretary must post a list of breaches of unsecured protected health information affecting 500 or more individuals. These breaches are now posted in a new, more accessible format that allows users to search and sort the posted breaches. Additionally, this new format includes brief summaries of the breach cases that OCR has investigated and closed, as well as the names of private practice providers who have reported breaches of unsecured protected health information to the Secretary. The following breaches have been reported to the Secretary.

[Show Advanced Options](#)

Breach Report Results						
Name of Covered Entity	State	Covered Entity Type	Individuals Affected	Breach Submission Date	Type of Breach	Location of Breached Information
Brooke Army Medical Center	TX	Healthcare Provider	1000	10/21/2009	Theft	Paper/Films
Mid America Kidney Stone Association, LLC	MO	Healthcare Provider	1000	10/28/2009	Theft	Network Server
Business Associate Present: No						
Web Description: Five desktop computers containing unencrypted electronic protected health information (e-PHI) were stolen from the covered entity (CE). Originally, the CE reported that over 500 persons were involved, but subsequent investigation showed that about 260 persons were involved. The ePHI included demographic and financial information. The CE provided breach notification to affected individuals and HHS. Following the breach, the CE improved physical security by installing motion detectors and alarm systems security monitoring. It improved technical safeguards by installing enhanced antivirus and encryption software. As a result of OCR's investigation the CE updated its computer password policy.						
Alaska Department of Health and Social Services	AK	Healthcare Provider	501	10/30/2009	Theft	Other, Other Portable Electronic Device
Health Services for Children with Special Needs, Inc.	DC	Health Plan	3800	11/17/2009	Loss	Laptop
Mark D. Lurie, MD	CA	Healthcare Provider	5166	11/20/2009	Theft	Desktop Computer
L. Douglas Carlson, M.D.	CA	Healthcare Provider	5257	11/20/2009	Theft	Desktop Computer
David I. Cohen, MD	CA	Healthcare Provider	857	11/20/2009	Theft	Desktop Computer
Michele Del Vicario, MD	CA	Healthcare Provider	6145	11/20/2009	Theft	Desktop Computer
Joseph F. Lopez, MD	CA	Healthcare Provider	952	11/20/2009	Theft	Desktop Computer
City of Hope National Medical Center	CA	Healthcare Provider	5900	11/23/2009	Theft	Laptop
The Children's Hospital of Philadelphia	PA	Healthcare Provider	943	11/24/2009	Theft	Laptop
Cogent Healthcare, Inc.	TN	Business Associate	6400	11/25/2009	Theft	Laptop
Democracy Data & Communications, LLC (	VA	Business Associate	83000	12/08/2009	Other	Paper/Films

Notice to the Secretary of HHS breach of unsecured protected health information affecting 500 or more individuals: <https://ocrportal.hhs.gov/ocr/breach/>

## How Good is HIPAA against Real Breaches?

- 56% **malicious misuses** and 44% **accidental misuses**
- Better coverage for malicious misuses than accidental misuses

# Natural Language Processing

- Breach description: Two laptop computers with questionable encryption were stolen from the Covered Entity (CE)'s premises.
- Follow-up action: The CE reported the theft to law enforcement.
- Follow-up action: The CE worked with the local police to recover the laptops.
- Follow-up action: The CE developed and implemented new policies and procedures to comply with the HIPAA Security Rule.
- Follow-up action: The CE placed an accounting of disclosures in the medical records of all affected individuals.
- Impact to practice: Standards for breach reporting

# User Expectations

- Existing design efforts divided between:
  - Secure software design disregards user expectations
  - Usable security and privacy research relies on heuristics about user attitudes (e.g., collected via interviews, surveys)
- Develop unified representations of user expectations and software implementation
- Identify discrepancies between user expectations and software implementation
- Implications to practice: Help IoT device developers, Android app developers

---

Kafalı et al. Nane: Identifying Misuse Cases Using Temporal Norm Enactments. Proceedings of the 20th International Requirements Engineering Conference (RE), pages 136-145, 2016

# Digital Forensics and Accountability

- Logging: Adequate vs excessive
- Computational models of accountability
- Improved threat modelling (e.g. attack/defense trees)
  - AI techniques such as intention recognition
  - Prioritisation of misuse via interactive game-playing
