

**NAME**

ffalse – Logical False

**SYNOPSIS**

Fortran (77, 90, 95, HPF):

**f77** [ *flags* ] *file(s)* ... -L/usr/local/lib -lgjl

**LOGICAL FUNCTION ffalse()**

C (K&R, 89, 99), C++ (98):

**cc** [ *flags* ] -I/usr/local/include *file(s)* ... -L/usr/local/lib -lgjl

Use

**#include <gampsi.h>**

to get this prototype:

**fortran\_logical ffalse(void);**

NB: The definition of C/C++ data types **fortran\_***xxx*, and the mapping of Fortran external names to C/C++ external names, is handled by the C/C++ header file. That way, the same function or subroutine name can be used in C, C++, and Fortran code, independent of compiler conventions for mangling of external names in these programming languages.

Last code modification: 01-Aug-2000

**DESCRIPTION**

Return the Fortran logical constant .FALSE. .

This function is intended to allow programs written in other languages to obtain the value of this implementation-dependent Fortran constant.

**SEE ALSO**

**ftrue**(3).

**AUTHORS**

The algorithms and code are described in detail in the paper

*Algorithm xxx: Quadruple-Precision Gamma(x) and psi(x) Functions for Real Arguments*

in ACM Transactions on Mathematical Software, Volume ??, Number ??, Pages ???-??? and ???-???, 2001, by
